Theoretical trajectory 3

Consider a final point (x_f, y_f, a_f) .

When $x_f \geq y_f$ and $45^\circ \geq a_f > -90^\circ$ and $y_{c2} > y_{c1}$,
a possible trajectory is:

CurveLeft(r, a)

CurveRight($r, a - a_f$)

1. Calculate r_1 and r_2 using distance d_{12} between points c_1 and c_2 , which define the center points of two circumference arcs of each curve:

$$c_1 = (x_{c1}, y_{c1})$$

$$x_{c1} = 0 \text{ and } y_{c1} = r_1, \text{ then}$$

$$c_1 = (0, r_1)$$

and,

$$c_2 = (x_{c2}, y_{c2}),$$

$$x_{c2} = x_f + r_2 \cdot \sin(|a_f|) \text{ and } y_{c2} = y_f - r_2 \cdot \cos(|a_f|), \text{ then}$$

$$c_2 = (x_f + r_2 \cdot \sin(|a_f|), y_f - r_2 \cdot \cos(|a_f|)).$$

Then,

$$d_{12} = ((x_f + r_2 \cdot \sin(|a_f|))^2 + (r_1 - y_f + r_2 \cdot \cos(|a_f|))^2)^{0.5} = r_1 + r_2.$$

As the equation d_{12} has two unknown variables r_1 and r_2 , there are three possible solutions to get only one unknown variable:

- i. $r_1 = r_2 = r \Rightarrow (2r)^2 = (x_f + r \cdot \sin(|a_f|))^2 + (r \cdot (\cos(|a_f|) + 1) - y_f)^2$

- ii. $r_1 = C \Rightarrow (r_2 + C)^2 = (x_f + r_2 \cdot \sin(|a_f|))^2 + (C + r_2 \cdot \cos(|a_f|) - y_f)^2.$

- iii. $r_2 = C \Rightarrow (r_1 + C)^2 = (x_f + C \cdot \sin(|a_f|))^2 + (r_1 + C \cdot \cos(|a_f|) - y_f)^2.$

2. Calculate angle a ,
$$d = \arcsin((x_f - r_2 \cdot \sin(|a_f|)) / (r_1 + r_2))$$

$$a = 180 - d$$

3. For example $(50, 40, -40)$ and considering equation 1.i for d_{12} , we get
$$(2r)^2 = (y_f - r \cdot (1 + \cos(|a_f|)))^2 + (x_f - r \cdot \sin(|a_f|))^2,$$

calculating the coefficients of resolvent formula,

$$a = 2 - 2 \cdot \cos(|a_f|),$$

$$b = 2 \cdot y_f \cdot (1 + \cos(|a_f|)) + 2 \cdot x_f \cdot \sin(|a_f|),$$

$$c = -(x_f^2 + y_f^2)$$

applying the resolvent formula, we get

$$r = 19,1$$

from equation on point 2,

$$a = 180 - \arcsin((50 - 19,1 \cdot \sin(40)) / (2 \cdot 19,1))$$

$$a = 99,4$$

4. The theoretical trajectory is,

CurveLeft($19,1, 99,4$)

CurveRight($19,1, 139,4$)

Note: In practice, the robot is not able to do a curve with a radius of 19,1cm due its manobrability constraints in 2D space.
